COLLECTIONS RECOVERY · LEADERSHIP DASHBOARD

The 11% “improvement” is a rebound off a dip — not a trend.

Seven complete months of Golden (de-duplicated) recovery data show no statistically detectable change, up or down.

FLAT · NO TREND DETECTED (p = 0.89)

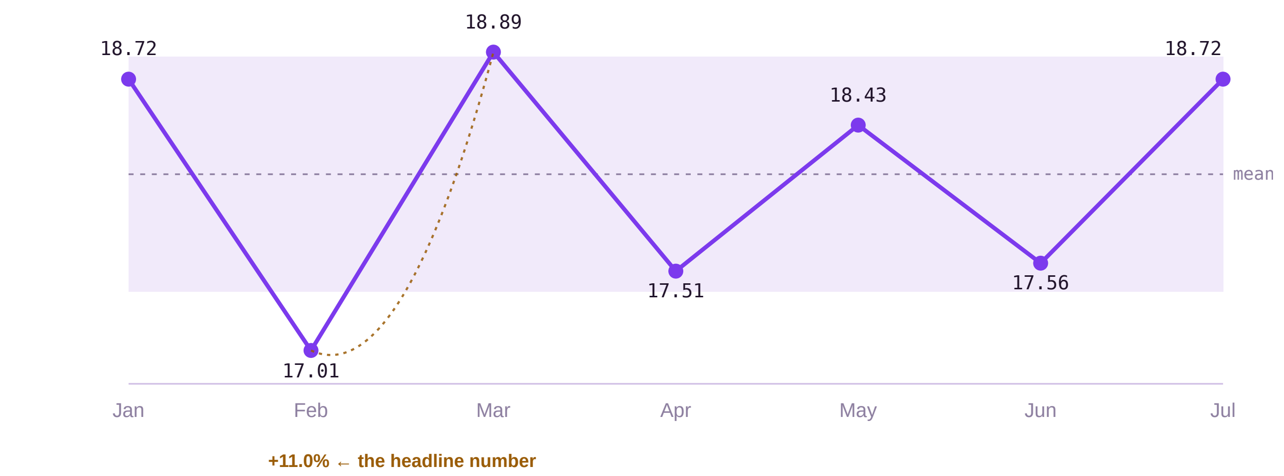
Analysis window
Jan – Jul 2026 (7 complete months)
Aug 2026 excluded — partial (8/31 days)
Basis: **Golden dataset**, de-duplicated

What happened

Monthly recovery, Rs Crore

Monthly recovery sits inside a normal noise band every month

Shaded band = ±1 standard deviation around the 7-month mean (Rs 18.12 Cr, std Rs 0.74 Cr, CV 4.1%)



Monthly recovery   ±1 std dev (normal range)

Why “+11%” is misleading

February was the low point of the window (−9.1% vs. January) — not a normal baseline. March's "+11%" is a rebound to roughly where January already was.

March is only +0.9% above January once you stop comparing from the trough.

A trend line through all 7 months is **statistically flat** — slope ≈ Rs 2.2 lakh/month, r^2 = 0.004, **p = 0.89**.

Coefficient of variation, Jan–Jul	4.1%
Largest single MoM swing (either direction)	11.0%
Contact rate trend significance	p = 0.97 (flat)
Aug 2026 (partial, 8 days)	excluded from trend

Every headline metric tells the same story

Jan–Jul range shown below each figure

CONTACT RATE
23.5%
range 22.5% – 24.0%

flat (p=0.97)

PTP RATE
15.1%
range 13.9% – 16.6%

no trend

PTP KEPT RATE
49.5%
range 48.5% – 50.7%

no trend

RECOVERY / AGENT-HOUR
Rs 16.6k
range Rs 16.1k – 17.0k

no trend

COST / RUPEE RECOVERED
not computable
no cost/spend data exists in source
data gap

Full statistical pipeline, not just single-factor cuts: a multivariate logistic regression on 89,071 account-months — month, risk segment, loan type, DPD bucket, attempt count and channel touches, all controlled for simultaneously, standard errors clustered by account — confirms the month effect is not real, and a power analysis confirms the test was strong enough to have caught it if it were.

0.659	±0.94pp	0.65pp	89,071
MONTH EFFECTS, CLUSTER-ROBUST WALD P	MIN. DETECTABLE EFFECT, 80% POWER	LARGEST EFFECT ACTUALLY OBSERVED	ACCOUNT-MONTHS MODELED

Why we don't trust the old number

Full evidence: reports/data_quality_report.md

Duplicate payments overstated recovery CONFIRMED
500 duplicate payment rows inflated reported SUCCESS amount by **Rs 2.59 Cr (1.93%)** across the extract. Fixed in the Golden dataset.

Most recovery can't be attributed to any campaign CONFIRMED
68% of successful payments have no traceable campaign touch within 30 days. Attribution window choice flips the "attributed campaign" for 27% of payments that can be attributed at all.

Account status has two disagreeing sources CONFIRMED
85.7% of accounts disagree between the account dimension's status and the latest event-log status. No data-level way to pick a winner — escalated to Engineering.

Agent & borrower identity are unresolved CONFIRMED
30,000 agent rows collapse to 1,000 real agents with scrambled names/teams; 77% of borrowers have internally conflicting city/phone/email. Geography analysis is not reliable.

Same numerator, 4x different "contact rate" RISK DEMONSTRATED
July's answered accounts read as 7.8%, 22.8%, or 31.1% depending purely on which denominator is chosen. No fixed metric registry exists today.

Portfolio mix, vendors and August's "decline" checked and cleared RULED OUT
Risk/loan-type mix is stable all year; all 15 telephony vendors perform identically; August's apparent −74.8% drop is a partial-month artifact, not a real decline.

Where the ₹10 Cr should go

WhatsApp / digital engagement — deployed in two gated phases

CONFIDENCE: LOW–MEDIUM

Every tested lever — agent, tenure, vendor, channel, attempt frequency, targeting strategy — showed **no effect distinguishable from noise**. Digital cadence is the one exception: a weak, not-yet-significant positive dose-response, and by far the cheapest and most reversible thing to test properly before committing the full budget. 86% of the book is already WhatsApp-reachable but touched only **once every 13 weeks** — frequency, not reach, is the binding constraint.

PHASE 0 · MONTHS 1–3
Rs 1.2 Cr
Randomized controlled pilot: 3x cadence + AI-personalized sequencing on ~13,000 accounts vs. held-out control. Pre-registered 14-day outcome window.

PHASE 1 · MONTHS 4–15 (GATED)
Rs 8.8 Cr
Scaled to the full 30,000-account book — released only if Phase 0 shows a statistically significant, positive lift.

SCENARIO	INCREMENTALITY	YEAR-1 INCREMENTAL RECOVERY	ROI ON RS 10 CR	BREAK-EVEN
Downside	3%	Rs 5.5 Cr	−45%	~22 months
Base case	**8%**	**Rs 14.7 Cr**	**+47%**	**~8–9 months**
Upside	15%	Rs 27.5 Cr	+175%	~4–5 months
